Class: _______________________

Date: _______________________

Time: 32 minutes

Marks: 31 marks

Comments:
Q1.
There is less carbon dioxide in the Earth’s atmosphere now than there was in the Earth's early atmosphere.

(a) The amount of carbon dioxide in the Earth’s early atmosphere decreased because it was used by plants and algae for photosynthesis, dissolved in the oceans and formed fossil fuels.

Give one other way that the amount of carbon dioxide in the Earth's early atmosphere decreased.

___________________________________________________________________

(4)

(c) The graphs in Figure 1 show the concentration of carbon dioxide in the atmosphere and global average surface temperature since 1900.

Figure 1
Calculate the percentage increase in the concentration of carbon dioxide from 1975 to 2000.

_____________________________ %

(1)

(d) What was the global average surface temperature in 1980?

Global average surface temperature = ______________ °C

(1)

(e) A student stated: ‘The graphs show that increasing the concentration of carbon dioxide in the atmosphere causes global temperature increases.’

Discuss why this statement is only partially true.

Q2.
In the last 200 years the concentration of carbon dioxide in the Earth’s atmosphere has risen.

Explain how a rise in carbon dioxide concentration in the atmosphere can decrease biodiversity.

Q3.
The pie chart below shows the composition of the atmosphere on the planet Mars.
(a) Use the pie chart above to calculate the percentage of carbon dioxide in the atmosphere on Mars.

___________________________________________________________________
___________________________________________________________________
___________________________________________________________________% 

(2)

(b) The atmosphere on Earth is very different from that on Mars. One important difference is that the Earth’s atmosphere contains a large amount of oxygen.

Give two other ways in which the Earth’s atmosphere is different from the atmosphere on Mars.

1. _________________________________________________________________

___________________________________________________________________
Q4.

The bar chart shows the composition of the Earth’s atmosphere today, and as it was billions of years ago.

(a) Use information from the bar chart to describe how the atmosphere today is different from the atmosphere of billions of years ago.

___________________________________________________________________
___________________________________________________________________
___________________________________________________________________

(b) Describe the processes which have brought about the changes in the proportions of these gases in the air over billions of years.

(Total 8 marks)
Mark schemes

Q1.
(a) sediment / limestone formation from carbonates 1

(b) short wavelength radiation 1
passes through atmosphere to Earth’s surface 1
Earth’s surface radiates different wavelengths 1
which are absorbed by greenhouse gases to produce temperature increase 1
allow CH₄ H₂O or CO₂ 1

(c) 13.8 % 1
allow values in the range 13.0 to 15.0 1

(d) 15.08 (°C) 1
allow values in the range 15.05 – 15.10 1

(e) correlation between CO₂ levels and temperature 1
despite short-term variations of temperature 1
supported by values from graph which show correlation 1
cannot determine causality from this data or possible causality as increasing use of fossil fuels since 1900 has caused accelerated temperature increase 1

Q2.
Level 3 (5–6 marks):
A full explanation is given that is coherent and logically structured, linking effect of increase in carbon dioxide to climate change and effects on biodiversity.

Level 2 (3–4 marks):
An attempt is made to link the effects of rising carbon dioxide levels to climate change and biodiversity. The logic may be inconsistent at times but builds towards a coherent explanation.

Level 1 (1–2 marks):
Discrete relevant points made. The logic may be unclear and attempts at reasoning may not be consistent.

0 marks:
No relevant content.
Indicative content

- rise in carbon dioxide increases atmospheric temperature / causes global warming
- global warming causes extreme weather patterns
- such as rise in sea levels
- increased or decreased rainfall
- frequency of storms / droughts
- rise in sea levels means habitats will change due to flooding
- rise in sea levels could increase salt in soil
- increased rainfall will increase water levels
- severity of storms / droughts could affect photosynthesis
- consequences of changes are loss of or damage to habitats
- which will affect animal and plant distributions
- by increasing migration or species dying off
- which decreases biodiversity

Q3.

(a) 95% (1 mark for working)

(b) Much less carbon dioxide
    Much more nitrogen

(c) Plants take up CO₂
    plants give out oxygen
    when they die trap CO₂ in rocks and fossil fuels
    methane and ammonia reacted with oxygen
    nitrogen gas produced
    by reaction of oxygen and ammonia
    and by denitrifying bacteria
    formation of ozone layer
    
    any 4 for 1 mark each

Q4.

(a) amount of CO₂ (much) lower
    amount of O₂ (much) higher
    amount of N₂ (much) higher (owtte.)
    less other gases/less NH₃/less CH₄
    
    any 2 for 2 marks

(b) 4 points from:
    plants (evolved)/photosynthesis/algae
    take in CO₂
    give out O₂
    water vapour condensed
    ozone formed from oxygen
    less CO₂ is produced now from volcanic activity
    CO₂ from air trapped in sedimentary rocks or fossil fuels
    nitrogen produced by bacteria/living organisms/microbes/decay of dead organisms (not nitrifying bacteria, nitrogen fixing 4 bacteria)
    nitrogen produced by reaction of NH₃ with O₂/decomposition of NH₃
    nitrogen builds up because it is unreactive
(Assume answer refers to today’s atmosphere)

any 4 for 1 mark each
